TEACHING

NEW COURSES DEVELOPED

- CEE570 Sustainable Environmental Biotechnologies (Graduate Students; 3 Credits). This course provides an introduction to principles of green chemistry and green engineering, and their integration in the design of sustainable bioengineering and biotechnology applications that protect environmental quality and human health. Case studies of unsustainable engineering are discussed along with alternative green biotechnologies to identify common design flaws and illustrate the value of bio-based processes in manufacturing, water and soil stewardship, and pollution prevention. Current U.S. regulations for environmental protection are presented and examined for their effectiveness in promoting a sustainable societal lifestyle. This course is tailored toward graduate students interested in gaining an understanding of the fundamentals of: Green Chemistry & Green Engineering; Sustainable Bioengineering; Public Health; and Biological Design.

This course is tailored toward undergraduate students interested in gaining an understanding of the fundamentals of: Green Chemistry & Green Engineering; Sustainable Bioengineering; Public Health; and Biological Design.
- HON494 Sustainable Environmental Biotechnologies (Barrett Honors College Undergraduate Students; 3 Credits). As above course CEE470 but customized to enable non-

engineering students to learn the theory and application of engineering principles to environmental problems and biotechnology solutions.

- BDE598 Biological Design Seminar. Lecture (Graduate Students; 1 Credit). This seminar series provides an introduction to the concepts and implementation of Biological Design in academia, society and commerce. Students will: understand interdisciplinary science of Biological Design and its key research fields; interact with key faculty that lead research in Biological Design fields; participate in proseminar format, where students focus on discussion questions before class and then discuss answers in class; and develop skills in identifying and discussing key scientific challenges that face our society.

- CEE598 Environmental Engineering Analytical Laboratory (Graduate Students; 3 Credits). This graduate-level course provides an overview of strategies for environmental monitoring. The course curriculum prepares students for both conducting hands-on research and critically interpreting environmental monitoring data obtained by standard and custom methods. Interspersed into lectures are laboratory demonstrations of analytical instrumentation. After successful completion of this course, students will be familiar with traditional and emerging analytical techniques (e.g., proteomics) for assaying diverse environmental matrices. Course topics include criteria for the selection of sampling and analytical methods, statistical determination of method detection limits, challenges arising from complex sample matrices (microbial biomass, wastewater, municipal sludge, cell cultures, food and blood), as well as approaches for data interpretation and graphical representation of monitoring information. Students are encouraged to integrate into the course curriculum particular analytical challenges of their research project through active participation and guest lectures.
